

SOLANA MOBILE BUILDER GRANT

# Defenders of the Realm

## *Echoes of Elarion*

A mobile-first strategy RPG, live on the Solana dApp Store. This proposal funds Seeker-native depth, first-session conversion, multi-language support, and a measurable production release.

Applicant DeNelle Studios · Package com.denellestudios.echoesofelarion · Stack Unity 6 / Android / Solana Mobile · September 2026

# A shipping game. Solana is infrastructure, not the pitch.

Players build and upgrade a medieval settlement, train an army, research advancements, defend the realm, and raid enemy strongholds. Sessions are short. Progression is persistent.

01

## BUILD

Place and upgrade the settlement on a persistent grid.

02

## TRAIN

Nine troop types, gated by research and economy.

03

## RAID

PvE strongholds with deploy, scoring, and loot.

04

## RETURN

Timers, queues, and daily progression that pull players back.

### DESIGN PRINCIPLE

Players should enjoy Echoes of Elarion as a game first. Seeker and Solana handle identity, payments, and distribution in the background — never as a tutorial the player has to survive before the game begins.

Multi-language support is now in active development so that first session, onboarding, and system messaging can reach Seeker players beyond a single locale.

# The gap is not more apps. It is more games that stay.

01

## Mobile-first, not a port

Designed as an Android game: touch-native input, phone-aspect UI verified panel by panel, and device QA on Seeker.

02

## Repeatable engagement

Construction timers, training, research, raids, and seasonal systems create real reasons to return — the behavior Solana Mobile needs from consumer titles.

03

## Solana-native distribution

Already published and updating through the Solana dApp Store, with a release pipeline purpose-built for that store rather than adapted after the fact.

04

## Room to go deeper

Wallet, signing, identity, activation, and localization can feel native instead of bolted on. That depth is what this grant funds.

# This is not a concept. It is in players' hands.

**LIVE**

**Solana dApp Store**

On a Seeker device the listing reads  
Open, not Install.

**08.17**

**Release published, 2026**

The next submission is an update, not a  
first listing.

**26 / 26**

**Build tiles art-dressed**

Every structure the grid offers now  
resolves its portrait.

**NOW**

**Multi-language support**

Localization architecture is in active  
build — not a future phase.

## SHIPPING SYSTEMS TODAY

- Town management — build, upgrade, train, research, one unified work queue
- PvE raids with deploy, scoring, and loot settlement
- Heroes, troops, defenses, crafting, storage, and a full resource economy
- Work orders, regression suites, device captures, and marker-verified release gates
- Localization foundation in progress — string tables, layout expansion, and first-session copy ready for additional locales

# Mobile Wallet Adapter is shipped, not planned.

The wallet rail is already integrated and hardened on a real Seeker. The grant funds depth on top of it — not a first integration.

|                       |             |                                                                                                                                    |
|-----------------------|-------------|------------------------------------------------------------------------------------------------------------------------------------|
| MWA integration       | SHIPPED     | Authorize and reauthorize run through Mobile Wallet Adapter as the wallet connection and signing path.                             |
| Session persistence   | SHIPPED     | A returning player is silently reauthorized instead of re-prompted — built after the defect was reproduced on a Seeker.            |
| Credential handling   | SHIPPED     | The MWA auth token is treated as a capability grant and encrypted at rest, never stored as a plain preference value.               |
| Artifact isolation    | ENFORCED    | The wallet rail compiles into the dApp Store build and out of the Play AAB — enforced by a gate that refuses to package otherwise. |
| Seed Vault validation | GRANT SCOPE | Signing never touches key material. Formal Seeker Seed Vault QA cases are Milestone 1 work.                                        |

# The payment rail is proven end to end.

## Purchase proven on devnet

Wallet authenticated, signature backend-verified, entitlement claimed exactly once, item delivered, fulfilment acknowledged durably before the receipt.

## Exactly-once entitlement

The claim happens before the grant, so a paid-but-not-granted case is loud rather than silent. Backend suite passes 13 of 13.

## The world stops mid-transaction

A single writer owns time control for the duration of a purchase, released on every exit path including exceptions.

### STATED PLAINLY

The rails are real.  
The revenue is not yet.

Purchases and ads both work. Every unit of revenue so far is our own testing — nobody outside the household has paid this game anything.

The infrastructure is ready to earn. That is different from earning. We would rather say so than round it up.

# SKR perks are already built.

Non-custodial by design. Players stake SKR natively through their own Seeker wallet. The game only reads the active stake and says thank you. It never mints, never custodies, and never holds a withdrawable balance.

## SEEKER

1 SKR

Badge

## VANGUARD

1,000

Title + trickle

## WARDEN

25,000

Cosmetic

## GENESIS

250,000

Title + cosmetic

Tiers are cumulative and owner-tunable in data, not code. Rewards are deliberately small — a thank-you, never pay-to-win.

## LIVE IN THE GAME TODAY

Stakers earn extra chances at higher-quality gems, plus their tier badge, title, and cosmetics. Shipped, not proposed.

## WHY IT STAYS SAFE

The stake is read, never moved. Nothing is minted, nothing is custodied, and the perks are cosmetic or chance-based — never power a player can buy.

# What the grant buys

A

## Solana Mobile Stack hardening

MWA edge cases, Seed Vault QA on Seeker, signing / reconnect / cancel states, and repeatable device test cases.

B

## Mobile UX, onboarding, and multi-language support

Finish the simplified Manage experience, make core loops legible without documentation, remove dead-end states, and ship the localization architecture now in build so first-session copy can land in multiple languages.

C

## Retention and Seeker activation

Daily and weekly return loops, raid-economy repeatability, a Seeker activation path, and the instrumentation to measure it.

D

## Production readiness

Device QA and regression, performance and memory pass, release automation, dApp Store refresh, and public developer notes.

*The honest gap this closes: the systems are built. The first session — and whether a player can read it — is what stops them ever seeing those systems.*

# Four milestones, each with evidence-based exit criteria.

M1 · WEEKS 1–3

## Mobile Stack & baseline

MWA / Seed Vault audit closed.  
Seeker QA checklist. Baseline funnel  
metrics captured.

EXIT

Supported wallet actions complete  
through the intended mobile path. No  
key material in the game.

M2 · WEEKS 4–6

## Mobile UX, first session, i18n

Simplified Manage ships. Onboarding  
for core loops. Dead-end states  
removed. Localization framework and  
first language packs land.

EXIT

A new player finds Build, Army, Research,  
Queue, and Raids without external help  
— in more than one language.

M3 · WEEKS 7–9

## Retention & activation

Daily and weekly loops. Raid  
economy repeatability. One Seeker  
activation path.

EXIT

Return-loop metrics instrumented. A  
Seeker activation path live or release-  
ready.

M4 · WEEKS 10–12

## Release & contribution

Performance and stability pass. dApp  
Store release. Public developer notes.

EXIT

Production build released. Grant  
deliverables documented with evidence.

# \$25,000, released against milestone exits.

**\$25,000**

Total requested over 12 weeks

Paid on milestone exits, not up front.

**WHY THIS SIZE**

Engine, art pipeline, backend, and store presence already exist and are paid for. The grant buys focused engineering time on the Seeker experience, the first session, and multi-language support.

# How we will know it worked.

Real baselines captured in Milestone 1. No invented numbers in this application.

## ACTIVATION

- ▶ dApp Store installs and qualified launches
- ▶ Wallet-connect completion rate
- ▶ First-session completion rate
- ▶ Time to first meaningful action
- ▶ Locale coverage of first-session flows

## PROGRESSION

- ▶ First build, train, or research action
- ▶ Reaching a first raid
- ▶ First-raid completion rate
- ▶ Seeker activation flow completion

## HEALTH

- ▶ D1 and D7 return rate
- ▶ Crash-free session rate
- ▶ Transaction and signing failure rate
- ▶ Review rating and themes

# Risks already under active management.

## Web3 distracts from the game

Game-first UX. Solana actions appear only where they give the player something.

## Wallet friction blocks activation

MWA-first flows, plain-language intent, explicit failure handling, and device testing on Seeker.

## Over-scoping a small team

Milestone delivery, strict P0/P1 separation, reuse of built systems, shipping increments.

## SKR becomes token-first

Treated as an optional experiment, never the justification for funding this work.

## Art-heavy Android performance

Texture-size controls, mobile compression, loading discipline, memory profiling, Seeker QA.

## Localization quality vs. speed

String-table architecture first; ship high-traffic surfaces before deep lore. Review before store refresh.

# Why this team can deliver in 12 weeks.

Led by a hands-on technical product lead with two decades in complex software delivery — release quality, regression, requirements, and cross-functional execution.

A working Android build, live on the dApp Store

Structured work orders with acceptance criteria and named owners

Automated regression suites gating every change

Headless capture and on-device verification before release

Marker-verified build gates — a run is not believed without proof

Frequent release cadence with documented release notes

## THE DISTINGUISHING HABIT

We do not claim what we have not measured.

Every technical claim in this deck was read from the shipping source, not a planning document. Where a number is not yet known — installs, retention — the slide says so instead of estimating.

That is the same discipline the milestones are written in.

\$25,000  
*over 12 weeks*

To turn a working, published Solana Android game into a deeply Seeker-native product — hardening the wallet rail, fixing the first session, shipping multi-language support, instrumenting real activation, and releasing a measurable dApp Store update.

#### PUBLIC-GOOD COMMITMENT

A postmortem on building a production mobile game for Solana Mobile. Documented MWA and Seed Vault integration lessons and failure cases. Device-performance findings for asset-heavy Unity Android apps. Small reusable utilities open-sourced where they do not expose game IP. Localization notes for Unity titles targeting the dApp Store.

DeNelle Studios · Defenders of the Realm: Echoes of Elarion  
Package `com.denellestudios.echoesofelarion`

#### APPLICATION PACKAGE

- 01 Public build and version number
- 02 App NFT address (no https listing URL exists for dApp Store titles)
- 03 Gameplay trailer
- 04 Repository or commit evidence
- 05 Install / session figures from the publisher console, inserted at submission
- 06 Legal entity and contact
- 07 Grant payment wallet address
