

Defenders of the Realm

Echoes of Elarion

A mobile-first strategy RPG with Pi SDK integration already in the codebase. This proposal funds Pi Browser reliability, playable onboarding, localization, and a focused capture-and-rebuild experience.

\$25,000 Requested	12 weeks Four proposed milestones	Built Pi SDK integration	Next Capture & rebuild

Applicant DeNelle Studios · Stack Unity 6 / WebGL / Pi Browser · Proposed funding plan September 2026

Save a castle. Capture a base. Make it yours.

The player journey: save the castle in Chapter One, venture into raids, capture a base, then repair and redesign it. Take that customized build into arena battles against AI or other players.

01

SAVE + RAID

Save the castle, then raid enemy strongholds.

02

CAPTURE

Take over the base as it stands, including damage.

03

DESIGN

Repair, rearrange, and earn stronger defenses.

04

ARENA

Bring your build into battles against AI or players.

DESIGN PRINCIPLE

The player owns the choices. A modest one-time capture grant covers essential repairs; stronger defenses, expansion, and upgrades remain earned. Guided actions teach the loop through play.

Existing story, raid, and base systems are the foundation. Capture settlement and competitive arena are planned milestones.

A persistent game gives players reasons to return.

01

Accessible through Pi Browser

A Unity WebGL path and Pi SDK bridge already exist. Funding targets loading, memory, touch usability, and real-browser reliability.

02

Progress that feels earned

An inherited base creates an immediate goal. Repairs, layout choices, raids, and later upgrades support short sessions with visible progress.

03

Useful Pi integration

Pi identity, quoted purchases, and rewarded-ad integration are implemented in source. Production eligibility and runtime proof remain separate gates.

04

Guidance across languages

Playable onboarding and localization make ownership, repair costs, and the next meaningful action understandable to more players.

An existing game, with a Pi-specific path to finish.

ANDROID

Published game foundation

Published on the Solana dApp Store for Android players.

PI SDK

Auth, payments, ads

Unity WebGL bridge and backend verification paths are present.

PLAY

Story, raids, base systems

Existing combat, placement, economy, and management systems.

NEXT

Pi Browser production QA

Load, memory, first-session, and approval evidence still needed.

FOUNDATION IN THE CURRENT CODEBASE

- Town management: build, upgrade, train, research, and work queues
- PvE raid combat, deployment, scoring, and loot flows
- Heroes, troops, defenses, crafting, storage, and resource economy
- Work orders, regressions, device captures, and release gates
- Localization foundation and first-session improvements in progress

PI BROWSER APP

echoesofelarions6578.
pinet.com

WEB HOST

echoes-of-elarion.
vercel.app

Pi integration is already in the codebase.

The proposal builds on an existing Unity WebGL bridge and backend. Code evidence establishes implementation; production validation and platform approvals are still explicit release gates.

Pi authentication	BUILT	The browser bridge initializes Pi SDK and requests authentication through the Pi platform adapter.
Server identity check	BUILT	The backend verifies the Pi access token against Pi identity before trusting the player account.
Quoted payments	BUILT	Server-owned quotes are compared with Pi payment details, including user, amount, and metadata, before approval.
Rewarded-ad path	BUILT	The WebGL platform exposes ad readiness and display; a backend verification path handles reward evidence.
Pi Browser release QA	PROPOSED	Validate loading, memory, sign-in, cancellation, purchase recovery, and approval requirements on supported devices.

Free-to-play with optional purchases and rewarded ads

Free-to-play strategy RPG

Players enter the core game without an upfront purchase. Raids, base development, and return play create the foundation for long-term engagement.

Optional purchases

The catalog includes cosmetics, resource packs, and time-saving conveniences such as repairs and builder capacity. Stronger progression remains an earned long-term goal.

Opt-in rewarded ads

Players can choose to watch an ad for a defined in-game benefit. Verified ad rewards provide a second revenue stream alongside optional purchases.

COMMERCIAL VALIDATION

Player choice.
Measurable demand.

Commercial testing to date has been limited to household use. An external revenue and retention baseline is not yet established.

Pi is a payment option, subject to production approval. Milestone 1 establishes the funnel baseline; later work measures return play and purchase completion.

“This base is yours.” Then learn by doing.

Agreed product direction: inherit the captured base and its damage. A modest one-time grant covers essential repairs. The proposed first playable slice teaches ownership through four real actions.

OWNERSHIP

Claim

Reveal your base

ESSENTIALS

Repair

Use starter supplies

PLAYER CHOICE

Design

Move or improve

PROVE IT

Test

Short AI battle

Grant size follows the actual essential-repair basket. One server settlement per capture entitlement prevents replay farming.

A REASON TO COME BACK

Keep meaningful early choices affordable. Earn stronger defenses, expansion, and later upgrades through continued play.

THE COMPETITIVE PATH

Use the customized base, defenses, hero, and squad in a shared AI/player arena design. Fair player battles need authoritative results and balance gates.

What the funding delivers

A

Pi Browser and SDK reliability

Load and memory profiling; sign-in, cancel, retry, payment, and rewarded-ad test cases; documented production approval requirements.

B

Playable onboarding and localization

Make core loops legible, remove dead ends, and ship priority first-session language coverage. Teach base ownership, essential repairs, and layout choice through actions that resume safely.

C

Capture-and-rebuild proof slice

One inherited base, damage and essential repair flow, one-time grant settlement, layout persistence, and an AI test using that build. Competitive player matches follow later gates.

D

Release evidence and contribution

Device/browser regression, performance pass, release candidate, approval submission package, baseline metrics, and public integration notes.

Bounded scope: prove the player journey on one base. Live competitive arena and broad content expansion are outside this initial funding request.

Four proposed milestones, with reviewable exits.

M1 · WEEKS 1–3

Pi Browser & baseline

Profile load and memory. Audit SDK flows and approval requirements. Capture baseline funnel metrics.

EXIT

Sign-in, cancel, retry, and payment cases have reproducible browser evidence; failures are visible.

M2 · WEEKS 4–6

First session & localization

Core-loop guidance, resumable milestones, and priority language coverage. Remove first-session dead ends.

EXIT

A new player reaches raids and understands the next objective without external instructions.

M3 · WEEKS 7–9

Capture & AI proof

Inherit one base. Repair, rearrange, persist, and test it against AI. Settle the starter grant once.

EXIT

Resume preserves choices; retries cannot repeat the grant; the AI test uses the saved layout.

M4 · WEEKS 10–12

Pi release & contribution

Stability pass, release candidate, approval package, metrics report, and public developer notes.

EXIT

Reviewable build and evidence delivered. External platform approval tracked separately.

\$25,000 proposed, across four milestones.

\$25,000

Total requested over 12 weeks

Milestone-based terms proposed for agreement.

WHY THIS SIZE

Engine, art pipeline, backend, and an Android release already exist. Funding focuses on Pi Browser reliability, the first session, localization, and a bounded capture-and-rebuild proof.

How we will know it worked.

Milestone 1 captures the baseline. Targets are agreed from measured starting points.

ACTIVATION

- ▶ Qualified Pi Browser launches
- ▶ Pi sign-in completion rate
- ▶ First-session completion rate
- ▶ Time to first meaningful action
- ▶ Locale coverage of first-session flows

PROGRESSION

- ▶ First build, train, or research action
- ▶ Reaching and completing a first raid
- ▶ Capture and essential-repair completion
- ▶ Saved layout and AI-test completion

HEALTH

- ▶ D1 and D7 return rate
- ▶ Crash-free session rate
- ▶ Payment and ad-settlement failure rate
- ▶ Browser load time and memory failures

Delivery risks and mitigations

Browser load and memory

Profile real Pi Browser devices; prioritize asset loading and measured memory fixes.

Sign-in or purchase interruption

Explicit cancel, retry, and recovery cases with server checks and browser evidence.

Scope exceeds a small team

One captured base and one AI proof slice; competitive player matches follow separate gates.

Platform approval timing

Prepare required evidence early. Track Mainnet and ad eligibility separately from code delivery.

Untrusted competitive results

Keep ranked rewards gated until authoritative match settlement and replay-abuse tests pass.

Localization quality

Prioritize first-session strings and layout expansion. Review translations in the playable flow.

An existing foundation. Accountable delivery.

Led by a hands-on technical product lead with two decades in complex software delivery, spanning release quality, regression, requirements, and cross-functional execution.

Published Android game on the Solana dApp Store

Structured work orders with acceptance criteria and named owners

Automated regression suites for core systems

Headless captures and on-device verification workflows

Build gates tied to recorded test results

Release notes and tracked acceptance criteria

FUNDED WORK YOU CAN REVIEW

Playable milestones. Visible progress.

Existing combat, base-building tools, and backend systems let funding focus on player experience. Each increment produces a working build, browser test evidence, and a clear next decision.

Review delivery against agreed acceptance criteria and measured player outcomes before the next milestone.

\$25,000

over 12 weeks

To bring an existing mobile strategy RPG through a focused Pi Browser release cycle: reliable SDK flows, clear first-session guidance, priority localization, and a capture-and-rebuild proof that leads toward AI and player arena battles.

PUBLIC-GOOD COMMITMENT

Publish practical Pi SDK and Unity WebGL integration lessons, interruption and recovery cases, browser performance findings, and localization notes. Share small reusable utilities where they do not expose game IP.
